

We claim :

1 ~~28~~. As an article of manufacture, thermoplastic injection molded paired spectacle lenses formed within a moldset having a parting line for opening between an A side and a B side of said moldset,

5 said paired lenses being suited as a unit of transfer in a multi-step automated manufacturing process comprising at least an automated demolding step, an automated liquid dip hardcoating step, and an automated drying and curing step,

10 said process being performed robotically within a cleanroom air enclosure, wherein said paired lenses are robotically handled from said demolding step through said dip hardcoating step and until said dip hardcoating has been dried and cured at least to a tackfree state within said cleanroom air enclosure,

said paired lenses comprising the elements of :

15 (a) two thermoplastic injection molded spectacle lens joined into a pair,

each of said lens having an outer perimeter forming a lens edge contoured for release out of a lens mold cavity,

20 said outer perimeter comprising four 90-degree quadrants defined in accordance with a clock face, wherein

an upper 90-degree quadrant is defined as being between 10:30 and 1:30 o'clock locations on the lens perimeter,

a lower 90-degree quadrant is defined as being between 4:30 and 7:30 o'clock locations on the lens perimeter,

25 a righthand side 90-degree quadrant is defined as being between 1:30 and 4:30 o'clock locations on the lens perimeter,

48

a lefthand side 90-degree quadrant is defined as being between 7:30 and 10:30 o'clock locations on the lens perimeter,

(b) a cold runner having a sprue connecting therebetween a left lens and a right lens in each pair, said cold runner being formed after molten thermoplastic flow from said sprue in fluid communication with said left lens and said right lens is stopped and then cooling to solidification joins together the lenses into a pair,

said cold runner being located in the righthand 1:30-4:30 o'clock side quadrant of the left lens and

10 said cold runner being located in the lefthand 7:30-10:30 o'clock side quadrant of the right lens,

(c) an integrally-molded hanger tab located substantially equidistant between said right lens and said left lens of said paired lens,

said hanger tab having a stem rising substantially vertically out of 15 said cold-runner connecting said paired lenses ,

said hanger tab having a head located on said stem at a point above a highest lens edge when said paired lenses are held vertically in a dipping position, so as to prevent liquid dip hardcoating from contacting robotic means for gripping said head,

20 and said paired lenses formed within said moldset at the end of each molding cycle are robotically handled in the following process steps :

(i) ejecting cleanly off said B side of said moldset being opened along the parting line, said step of ejecting being initiated only when end-of-arm tooling of a takeout robot is in place to receive said paired

25 lenses ;

49

- 48 -
- 2 -

(ii) handling said paired lenses by automation within said cleanroom air enclosure without any human operators therein,

without any cold runner cutting step or any step of trimming of any tabs off the molded lens before dipcoating, and

5 without use of Freon CFC nor aqueous cleaning protocols before dipcoating ;

(iii) dipcoating said paired lenses by said robotic means gripping said head while preventing liquid dip hardcoating from contacting said robotic means ;

10 (iv) drying and curing after dipcoating said paired lenses at least to a tackfree state within said cleanroom air enclosure.

2
29. An article of Claim ¹/₂₈ wherein said paired lenses are formed within multicavity injection-compression molds employing a variable volume mold cavity process.

3
15 30. An article of Claim ¹/₂₈ wherein each of said lens having an outer perimeter forming a lens edge contoured for release out of a lens mold cavity ,

and said lens edge has a positive draft angle formed on said B side .

4
31. An article of Claim ¹/₂₈ wherein said cold runner having a sprue
20 connecting therebetween a left lens and a right lens in each pair,

and said sprue has a cold well having negative controlled-draft-angle to grip said paired lenses onto said B side.

5
32. An article of Claim ¹/₂₈ wherein each of said lens having an outer perimeter forming a lens edge contoured for release out of a lens mold
25 cavity ,

50

and said lens edge has an edge seal overlap on said A side.

6
33. An article of Claim ¹/₂₈ having an additional element of

(d) one or more ejector tabs are employed,

5 said ejector tabs only being located along the lens perimeter so as not to interfere with proper dipcoating and not to propagate coating flowout runs , and

none of such tabs being located in the upper quadrant.

R 1.26
7
34. An article of Claim ¹/₂₈ having an additional element of

(d) one or more drip tabs are employed,

10 said drip tabs only being located along the lens perimeter in the bottom quadrant of each lens (4:30-7:30 o'clock positions), to minimize dipcoating dripmark size, by capillary wicking action to drain off excess liquid coating once the molded paired lens have been fully removed from immersion in the dipbath.

8
15 35. An article of Claim ¹/₂₈ wherein said paired lenses are polycarbonate spectacle lens for vision correction.

9
36. An article of Claim ¹/₂₈ wherein said takeout robot in place to receive said paired lenses upon ejection is of a side entry type, and modular blowers supplying HEPA-filtered air are located directly above
20 platens of an injection molding machine within which said moldset is mounted, so as to maintain a positive-air-pressure within said cleanroom air enclosure which substantially surrounds said moldset.

10
37. An article of Claim ⁹~~36~~ wherein said side entry type takeout robot operates within a clean-room-enclosed tunnel between said moldset and an enclosed HEPA-filtered automated dipcoating machine.

11
38. An article of Claim ¹~~28~~ wherein after said takeout robot has received
5 said paired lenses upon ejection, a step of cooling and removal of electrostatic charge of said paired lenses is performed before said step (iii) of dipcoating.

12
39. An article of Claim ¹~~28~~ wherein said step of cooling and removal of electrostatic charge of said paired lenses is performed by immersion
10 into a circulating filtered alcohol bath before said step (iii) of dipcoating.

13
40. An article of Claim ¹~~28~~ wherein said step (iii) of dipcoating said paired lenses employs a programmable SCARA cylindrical type robot, as a second robotic device to grip said paired lenses by said hanger tab,
15 said programmable SCARA cylindrical type robot being fitted with jaws cut with a mating geometry for retaining said head of said hanger tab of said paired lenses, for gripping said head while preventing liquid dip hardcoating from contacting said robotic means.

14
41. An article of Claim ¹³~~40~~ wherein said step (iii) of dipcoating said
20 paired lenses employing said programmable SCARA cylindrical type robot gripping said paired lenses by said hanger tab employs :

(a) a filtered circulating bath of liquid hardcoating of 2-10 centistoke viscosity ;

(b) a withdrawal speed of at least 20 inches per minute.

15

14

42. An article of Claim ~~41~~ wherein said step (iii) of dipcoating said paired lenses employing said programmable SCARA cylindrical type robot gripping said paired lenses by said hanger tab further employs :

(a) a filtered circulating bath of liquid hardcoating of 2-5 centistoke viscosity and formulated at less than 25% solids using mainly high-evaporation-rate solvents such as low molecular weight alcohols and ketones ;

(b) a withdrawal speed of 0.5-5 inches per second ;

(c) following a first dip with a second dip.

16

10 43. An article of Claim ~~28~~ wherein said step (iv) of drying and curing after dipcoating said paired lenses at least to a tackfree state within said cleanroom air enclosure employs a rotary index drive fitted with a plurality of workholder arms,

each workholder arm being fitted with mating geometry for retaining

15 said head of said hanger tab of said paired lenses,

operating as a carousel curing workstation.

17

44. An article of Claim ~~28~~ wherein said a step of inserting said paired lenses into a lensholder rack within said cleanroom air enclosure employs said head of said hanger tab of said paired lenses for a spring interference fit for its mechanical retention means.

18

45. As an article of manufacture, polycarbonate injection-compression molded paired spectacle lenses for vision correction formed within a variable volume multicavity moldset having a parting line for opening between an A side and a B side of said moldset,

25 said paired lenses being suited as a unit of transfer in a multi-step automated manufacturing process comprising at least an automated

53

-52-

demolding step, an automated liquid dip hardcoating step, and an automated drying and curing step,

said process being performed robotically within a cleanroom air enclosure, wherein said paired lenses are robotically handled from said
5 demolding step through said dip hardcoating step and until said dip hardcoating has been dried and cured at least to a tackfree state within said cleanroom air enclosure,

said paired lenses comprising the elements of :

(a) two polycarbonate injection-compression molded paired spectacle
10 lens for vision correction joined into a pair,

each of said lens having an outer perimeter forming a lens edge contoured for release out of a lens mold cavity, and said lens edge has a positive draft angle formed on said B side,

said outer perimeter comprising four 90-degree quadrants defined in
15 accordance with a clock face, wherein

an upper 90-degree quadrant is defined as being between 10:30 and 1:30 o'clock locations on the lens perimeter,

a lower 90-degree quadrant is defined as being between 4:30 and 7:30 o'clock locations on the lens perimeter,

20 a righthand side 90-degree quadrant is defined as being between 1:30 and 4:30 o'clock locations on the lens perimeter,

a lefthand side 90-degree quadrant is defined as being between 7:30 and 10:30 o'clock locations on the lens perimeter,

(b) a cold runner having a sprue connecting therebetween a left lens and
25 a right lens in each pair, said cold runner being formed after molten thermoplastic flow from said sprue in fluid communication with said left

SH

lens and said right lens is stopped and then cooling to solidification joins together the lenses into a pair, and said sprue has a cold well having negative controlled-draft-angle to grip said paired lenses onto said B side,

5 said cold runner being located in the righthand 1:30-4:30 o'clock side quadrant of the left lens and

 said cold runner being located in the lefthand 7:30-10:30 o'clock side quadrant of the right lens,

(c) an integrally-molded hanger tab located substantially equidistant

10 between said right lens and said left lens of said paired lens,

 said hanger tab having a stem rising substantially vertically out of said cold-runner connecting said paired lenses ,

 said hanger tab having a head located on said stem at a point above a highest lens edge when said paired lenses are held vertically in a

15 dipping position, so as to prevent liquid dip hardcoating from contacting robotic means for gripping said head,

and said paired lenses formed within said moldset at the end of each molding cycle are robotically handled in the following process steps :

(i) ejecting cleanly off said B side of said moldset being opened
20 along the parting line, said step of ejecting being initiated only when end-of-arm tooling of a side entry takeout robot is in place to receive said paired lenses ;

(ii) handling said paired lenses by automation within said cleanroom air enclosure without any human operators therein,

25 without any cold runner cutting step or any step of trimming of any tabs off the molded lens before dipcoating, and

55

without use of Freon CFC nor aqueous cleaning protocols before dipcoating ;

(iii) cooling and removal of electrostatic charge of said paired lenses ;

5 (iv) dipcoating said paired lenses with a programmable SCARA cylindrical type robot, as a second robotic device to grip said paired lenses by said hanger tab,

said programmable SCARA cylindrical type robot being fitted with jaws cut with a mating geometry for retaining said head of said hanger
10 tab of said paired lenses, for gripping said head while preventing liquid dip hardcoating from contacting said robotic means,

employing :

(a) a filtered circulating bath of liquid hardcoating of 2-10 centistoke viscosity ;

15 (b) a withdrawal speed of at least 20 inches per minute ;

(v) drying and curing after dipcoating said paired lenses at least to a tackfree state within said cleanroom air enclosure,

employing a rotary index drive fitted with a plurality of workholder arms,

20 each workholder arm being fitted with mating geometry for retaining said head of said hanger tab of said paired lenses,

operating as a carousel curing workstation.
